# BRIT Systems

## Company Overview

BRIT Systems, a wholly owned subsidiary of Imaging Advantage (IA), has been a leader in the PACS/RIS and teleradiology world since 1993, setting the standard for highly available solutions, business continuity and disaster recovery solutions, proactive system monitoring and support of industry standards. Over time, offerings have expanded to include many other tools required in the radiology workflow such as browser-based image sharing, DICOM routing and morphing, Critical Tests Results Management (CTRM), Peer Review, QC Workstations, CD burners and Single Worklists for radiologists reading for multiple sites. Since all applications are written by BRIT, products integrate seamlessly. BRIT's open architecture systems are built using the latest DICOM and HL-7 standards according to the IHE directives, so they integrate well with other vendors, too. Supporting all image types, the xds standard, and architected from the ground up to support multiple tenants, BRIT's archives are VNAs.

Security is a hallmark of BRIT's products. Products support granular permissions for user roles and patient access. HIPAA logs are readily available to system administrators. All servers are built using UNIX which is inherently more secure than other Operating Systems and all systems are thoroughly scanned on a regular basis to assure all vulnerabilities have been addressed.

BRIT's motto of "any image, anytime, anywhere" is now fully realized: anyone in the world with an Internet connection and browser can view and share studies with our free 20 GB BRIT Cloud offering. Even money is no longer a barrier.

BRIT's implementation team is experienced in performing installations of all sizes, of varying complexity and with diverse networking environments. Workflow experts possess both DICOM and HL-7 integration skills, enabling efficient, accurate integration with both modalities and information systems. Experienced networking engineers set up and maintain VPN connections daily. 24 x 7 monitoring allows BRIT's service team to proactively manage the systems. Optionally, IA's Concierge Services team can monitor the PACS workflow and interact with radiologists and imaging sites.

As a customer focused company, BRIT's service team and developers know our clients and work closely with both clients and our parent company to design new features in the relentless pursuit of enhancing efficiency and effectiveness. Providing radiology services is our core business.

BRIT products and services are available directly through BRIT, via the DINPACS III contract and through business partners. Capital purchases and price-per-study models are available. Today BRIT has installations at over 500 locations.

For more information about BRIT's products and services, visit our web site at [www.brit.com](http://www.brit.com) and sign up for a virtual DICOM server.
